1 Basis elements

For the 4-site Hubbard model at half filling with $S_z = 0$, there are in total 36 basis elements. I used a string of binaries to represent occupied and unoccupied momenta. Four entries represent four momenta, small to large, from right to left, shown below:

$$(a, b, c, d) \\ (3\pi/2, \pi, \pi/2, 0)$$

For example, $(0, 0, 1, 1)$ means momenta 0 and $\pi/2$ are occupied; $(1, 0, 1, 0)$ means momenta $\pi/2$ and $3\pi/2$ are occupied. I then gave each and every four-binary string a index:

$$\begin{aligned} 0011 &\rightarrow 1 \\ 0101 &\rightarrow 2 \\ 0110 &\rightarrow 3 \\ 1001 &\rightarrow 4 \\ 1010 &\rightarrow 5 \\ 1100 &\rightarrow 6 \end{aligned}$$

Since we have in total four electrons, this is just half of the picture. The other half is constructed by adding another four-binary string to these six. The index of the final string is defined using $6 \cdot (i-1) + j$, where i is the index for the first string, j is the index for the second string. For example, to construct the basis element that represents $0 \uparrow 2 \uparrow 0 \downarrow 1 \downarrow$, we use $(0, 1, 0, 1)$ and $(0, 0, 1, 1)$, since

$$\begin{aligned} (0, 1, 0, 1) &\rightarrow 0 \uparrow 2 \uparrow \\ (0, 0, 1, 1) &\rightarrow 0 \downarrow 1 \downarrow \end{aligned}$$

The whole string then becomes

$$(0, 1, 0, 1, 0, 0, 1, 1) \rightarrow 0 \uparrow 2 \uparrow 0 \downarrow 1 \downarrow$$

Notice I put the string for up spins first. The index for the first string is 2, and the second one is 1, so the total index for $(0, 1, 0, 1, 0, 0, 1, 1)$ is then $6 \cdot (2 - 1) + 1 = 7$. Below I attach a figure showing all basis elements directly from the code.

2 Hamiltonian

The Hamiltonian I used is:

$$H = \sum_{k\sigma} \epsilon(k) n_{k\sigma} - \frac{U}{4} \sum_{k_1, k_2, k_3} c_{k_1+k_2-k_3\uparrow}^\dagger c_{k_3\downarrow}^\dagger c_{k_2\uparrow} c_{k_1\downarrow}, \quad (1)$$

where $\epsilon(k) = -2t\cos(k)$. Note the minus sign here. It's because I swap the $c_{k_2\uparrow}$ and $c_{k_3\downarrow}^\dagger$ operators.

{1: (0, 0, 1, 1, 0, 0, 1, 1),
 2: (0, 0, 1, 1, 0, 1, 0, 1),
 3: (0, 0, 1, 1, 0, 1, 1, 0),
 4: (0, 0, 1, 1, 1, 0, 0, 1),
 5: (0, 0, 1, 1, 1, 0, 1, 0),
 6: (0, 0, 1, 1, 1, 1, 0, 0),
 7: (0, 1, 0, 1, 0, 0, 1, 1),
 8: (0, 1, 0, 1, 0, 1, 0, 1),
 9: (0, 1, 0, 1, 0, 1, 1, 0),
 10: (0, 1, 0, 1, 1, 0, 0, 1),
 11: (0, 1, 0, 1, 1, 0, 1, 0),
 12: (0, 1, 0, 1, 1, 1, 0, 0),
 13: (0, 1, 1, 0, 0, 0, 1, 1),
 14: (0, 1, 1, 0, 0, 1, 0, 1),
 15: (0, 1, 1, 0, 0, 1, 1, 0),
 16: (0, 1, 1, 0, 1, 0, 0, 1),
 17: (0, 1, 1, 0, 1, 0, 1, 0),
 18: (0, 1, 1, 0, 1, 1, 0, 0),
 19: (1, 0, 0, 1, 0, 0, 1, 1),
 20: (1, 0, 0, 1, 0, 1, 0, 1),
 21: (1, 0, 0, 1, 0, 1, 1, 0),
 22: (1, 0, 0, 1, 1, 0, 0, 1),
 23: (1, 0, 0, 1, 1, 0, 1, 0),
 24: (1, 0, 0, 1, 1, 1, 0, 0),
 25: (1, 0, 1, 0, 0, 0, 1, 1),
 26: (1, 0, 1, 0, 0, 1, 0, 1),
 27: (1, 0, 1, 0, 0, 1, 1, 0),
 28: (1, 0, 1, 0, 1, 0, 0, 1),
 29: (1, 0, 1, 0, 1, 0, 1, 0),
 30: (1, 0, 1, 0, 1, 1, 0, 0),
 31: (1, 1, 0, 0, 0, 0, 1, 1),
 32: (1, 1, 0, 0, 0, 1, 0, 1),
 33: (1, 1, 0, 0, 0, 1, 1, 0),
 34: (1, 1, 0, 0, 1, 0, 0, 1),
 35: (1, 1, 0, 0, 1, 0, 1, 0),
 36: (1, 1, 0, 0, 1, 1, 0, 0)}

Figure 1: All 36 basis elements and their indices. The first four binaries are up spins, the second four are down spins.

3 Matrix construction

The U matrix is created by applying $c_{k_1+k_2-k_3\uparrow}^\dagger c_{k_3\downarrow}^\dagger c_{k_2\uparrow} c_{k_1\downarrow}$ operator to each basis element for different k_1 , k_2 , and k_3 , and then project the resulted row vector onto column vectors. Indices k_1 , k_2 , and k_3 cover every possible excitation, for example, for the basis element $(0, 1, 1, 0, 1, 1, 0, 0)$, k_1 can be 2 or 3, k_2 can be 5 or 6, and k_3 can be 0 or 1. Note here the indices are inverted, meaning 0 to 7 runs from the far right to the left-most index. Finally $k_1 + k_2 - k_3$ takes whichever index available. For example, if we picked $k_1 = 2$, $k_2 = 5$, $k_3 = 0$, and then the other index has to be $2 + 5 - 0 = 7$, to conserve momentum, the resulted state is $(1, 1, 0, 0, 1, 0, 0, 1)$, the first annihilation operator commutes through 3 operators; the second commutes through 1 operator; the third commutes through 2 operators, and the last commutes through 0 operators. So the total sign is +1. $(1, 1, 0, 0, 1, 0, 0, 1)$ has a total index of 34, so one of the possible excitation from $(0, 1, 1, 0, 1, 1, 0, 0)$ is $|34\rangle$.

```
row(18)
```

```
[[1, '34'], [1, '4'], [-1, '29'], [1, '8'], [-1, '33'], [-1, '3']]
```

Figure 2: $(0, 1, 1, 0, 1, 1, 0, 0)$ has a total index of 18, therefore the function `row(18)` outputs all possible excitations of this basis element, and their corresponding signs.

The corresponding matrix element is then constructed by projecting the row element onto columns, for example,

$$\begin{aligned}\langle 29|U|2\rangle &= -1, \\ \langle 8|U|2\rangle &= 1.\end{aligned}$$

I then run the `row` function for all 36 basis elements, and then use such projection method to construct all 36×36 matrix elements. That's the method I used in my exact diagonalization code.

The T matrix is simple. One just use a function that runs through a string of a basis element, recording all nonzero entries and their positions k . Using the equation $\epsilon(k) = -2\cos(k)$ for all k values, and sum them all up. Here k takes values of $3\pi/3$, π , $\pi/2$, and 0, going from left to right.
